Configuration Guide

SmartConnector for IBM WebSphere File

November 30, 2016

Revision History

Date	Description
11/30/2016	Updated installation procedure for setting preferred IP address mode.
06/30/2014	Added support for WebSphere 8.5.
05/15/2012	Added new installation procedure.
02/15/2011	Added support for WebSphere 6.0, 6.1, and 7.0.
02/11/2010	Added support for FIPS Suite B and CEF File transport.
08/12/2009	Added support for multiple log files; updated field mappings.
06/30/2009	Global update to installation procedure for FIPS support.

Contents

SmartConnector for IBM WebSphere File

This guide provides information for installing the SmartConnector for IBM WebSphere File and configuring the device for log file event collection. IBM WebSphere versions 4.0, 5.0, 6.0, 6.1, 7.0, and 8.5 are supported.

Product Overview

WebSphere provides application integration by passing messages between applications and Web services, reducing the risk of information loss and the need to reconcile communicating IT systems by using queuing and transactional facilities that help preserve the integrity of messages across the network.

Configure WebSphere Application Server Logs

About WebSphere Logging

WebSphere Application Server can write system messages to several general purpose logs. These include the Java Virtual Machine (JVM) logs (system.err and system.out), the process logs (native.err and native.out), and the Start Server and Stop Server logs that are processed by the ArcSight SmartConnector.

JVM Logs

The JVM logs are created by redirecting the system.out and system.err streams of the JVM to independent log files. WebSphere Application Server writes formatted messages to the system.out stream. The system.err log contains exception stack trace information that can be used in problem analysis. Because each application server represents a JVM, there is one set of JVM logs for each application server and all its applications, located by default in the **installation_root/logs/server_name** directory. In the case of a WebSphere Application Server network deployment, JVM logs also are created for the deployment manager and each node manager, because they also represent JVMs.

Process Logs

The process logs are created by redirecting the stdout and stderr streams of the process to independent log files. Native code writes to these files. These files can contain information relating to problems in native code or diagnostic information written by the JVM. As with JVM logs, there is a set of process logs for each application server, since each JVM is an operating system process, and in the case of a WebSphere network deployment, a set of process logs for the deployment manager and each node manager.

Start Server Logs

You can use the **startServer** command to start an application server from the command line. You can run this command from the **install_root/bin** directory of a WebSphere Application Server application or a Network Deployment installation.

The following command starts the server, specifies a particular log file, and generates trace information into the file specified with the **logfile** option for debugging purposes:

```
startServer <server> logfile <filename> trace
```

Stop Server Logs

You can use the **stopServer** command to stop an application server from the command line. You can run this command from the **install_root/bin** directory of a WebSphere Application Server installation or a Network Deployment installation.

The following command stops the server, specifies a particular log file, and generates trace information into the file specified with the **logfile** option for debugging purposes:

```
stopServer <server> logfile <filename> trace
```

Server Plug-In Logs

Use this page from the administrative console to view or change the settings of a Web server plug-in configuration file. The plug-in configuration file, **plugin_cfg.xml**, provides properties for establishing communication between the Web Server and the Application Server.

From the administrative console page, select Plug-In Properties for your Web server. On the **Configuration** tab, you can edit fields. On the **Runtime** tab, you can look at read-only information. (The Runtime tab is available only when this Web server has accessed applications running on application servers and there is an http_plugin.log file.)

Plug-in log file name specifies the fully qualified path to the log file to which the plug-in will write error messages. The default file path is:

```
plugin_install_root/logs/web_server_name/http_plugin.log
```

If the file does not exist, it will be created. If the file already exists, it will be opened in append mode and the previous plug-in log messages will remain. This field corresponds to the RequestMetrics **loggingEnabled** element in the **plugin-cfg.xml** file.

Configure Logging

For complete information about WebSphere logging, see the IBM WebSphere Application Server Information Center for your version of WebSphere. Information in this section has been derived from the Administration section.

> Be aware that performance degradation can occur when the WebSphere Application Server logging level is enabled at a level higher than INFO (for example, FINE, FINER, or FINEST).

Use the WebSphere Application Server Administrative console to set up and configure WebSphere logging and tracing. You can use the following URL to access the Administrative console:

```
http://server-name:admin-console-port-number/ibm/console
```

where `server-name` is the name of the CM Server computer and `admin-console-port-number` is the Administrative console port number (12060 by default with CM Server, or 9060 for other WebSphere Application Server versions).

To configure WebSphere Application Server logging and tracing:

1   From the Administration console, click **Troubleshooting -> Logging and Tracing** and select the server to configure.

2   Select **Change Log Detail Level** and click the **Runtime** tab. Changes made to the **Runtime** tab take effect as soon as you save them. Changes made to the **Configuration** tab do not take effect until you restart the server.

     a   Select the **Save runtime changes to configuration as well** check box if you want the changes to persist.

     b   Click the **Components** link. Note that ***=info** is listed in the box.

     c   Open the option **com.ibm.rational.*** and select **com.ibm.rational.stp.*** for all CM Server packages. Or, select one of the packages listed under **com.ibm.rational.stp.*** to change the logging level for only that package.

     d   Click the **Message and Trace Levels** option to select the level.

     e   Click **OK**. Then click **Save** in the **Messages** area at the top of the page that opens. Changes take effect without restarting the server.

3   If the version or class of Websphere Application Server on your CM Server system does not provide a **Runtime** tab that enables real-time configuration changes, use the **Configuration** tab. Then restart the server to affect the saved changes.

4   Increasing the default settings for the log file size and the number of log files to rotate may be necessary. Set the number of log files to rotate through to at least 20, and set the log file size to at least 20 MB. Use the WebSphere Administrative console to change the JVM log file size and file rotation settings:

     a   Select **Troubleshooting -> Logging and Tracing**.

     b   Select the relevant server from the list of servers to configure.

     c   Select **JVM Logs**. Then click the **Configuration** tab. (You can use the **Runtime** tab to view the current `SystemOut.log` and `SystemErr.log` file contents.)

     d   Modify the `SystemOut` and `SystemErr` locations, file sizes (should be at least 20 MB), and how many historical files to maintain (should be at least 20 MB).

     e   Click **OK**. Then click **Save** in the **Messages** area at the top of the page that opens.

WebSphere Application Server log files are written to the following locations:

```
UNIX: /opt/rational/common/CM/profiles/cmprofile/logs/server1/

Windows: \Program
Files\IBM\RationalSDLC\common\CM\profiles\cmprofile\logs\server1\
```

Install the SmartConnector

The following sections provide instructions for installing and configuring your selected SmartConnector.

> Connector Appliance/ArcSight Management Center supports mounting for Network File System (NFS) and CIFS (Windows) shares. When you install this connector on one of these devices, establish a CIFS mount on the device before adding the connector. Provide this share name during connector configuration. For more information, see **Remote File Systems** in the Connector Appliance or ArcSight Management Center Administrator's Guide.

Prepare to Install Connector

Before you install any SmartConnectors, make sure that the ArcSight products with which the connectors will communicate have already been installed correctly (such as ArcSight ESM or ArcSight Logger). This configuration guide takes you through the installation process with **ArcSight Manager (encrypted)** as the destination.

For complete product information, read the *Administrator's Guide* as well as the *Installation and Configuration* guide for your ArcSight product before installing a new SmartConnector. If you are adding a connector to the ArcSight Management Center, see the *ArcSight Management Center Administrator's Guide* for instructions, and start the installation procedure at "Set Global Parameters (optional)" or "Select Connector and Add Parameter Information."

Before installing the SmartConnector, be sure the following are available:

■ Local access to the machine where the SmartConnector is to be installed

■ Administrator passwords

Install Core Software

Unless specified otherwise at the beginning of this guide, this SmartConnector can be installed on all ArcSight supported platforms; for the complete list, see the *SmartConnector Product and Platform Support* document, available from the HPE SSO and Protect 724 sites.

1   Download the SmartConnector executable for your operating system from the HPE SSO site.

2   Start the SmartConnector installation and configuration wizard by running the executable.

Follow the wizard through the following folder selection tasks and installation of the core connector software:

Introduction
Choose Install Folder
Choose Shortcut Folder
Pre-Installation Summary
Installing...

3   When the installation of SmartConnector core component software is finished, the following window is displayed:

Set Global Parameters (optional)

If you choose to perform any of the operations shown in the following table, do so before adding your connector. After installing core software, you can set the following parameters:

| Global Parameter	Setting
Set FIPS mode	Set to 'Enable' to enable FIPS compliant mode. To enable FIPS Suite B Mode, see the SmartConnector User Guide under "Modifying Connector Parameters" for instructions. Initially, this value is set to 'Disable'.
Set Remote Management	Set to 'Enable' to enable remote management from ArcSight Management Center. When queried by the remote management device, the values you specify here for enabling remote management and the port number will be used. Initially, this value is set to 'Disable'.
Remote management listener port	The remote management device will listen to the port specified in this field. The default port number is 9001.
Preferred IP Version	If both 'IPv4' and'IPv6' IP addresses are available for the local host (the machine on which the connector is installed), you can choose which version is preferred. Otherwise, you will see only one selection. When both values are present, the initial setting is 'IPv4'.

After making your selections, click **Next**. A summary screen is displayed. Review the summary of your selections and click **Next**. Click **Continue** to return to the "Add a Connector" window. Continue the installation procedure with "Select Connector and Add Parameter Information."

Select Connector and Add Parameter Information

1   Select **Add a Connector** and click **Next**. If applicable, you can enable FIPS mode and enable remote management later in the wizard after SmartConnector configuration.

2   Select **IBM WebSphere File** and click **Next**.

3 Enter the required SmartConnector parameters to configure the SmartConnector, then click **Next**.

Parameter	Description
Instance ID	Custom Host Name and Instance ID; the default value is 'localhost'.
System Out Log File Path	Absolute path to the system.out Java Virtual Machine (JVM) log file.
System Err Log File Path	Absolute path to the system.err Java Virtual Machine (JVM) log file.
Native StdOut Log File Path	Absolute path to the native.stdout Process log file.
Native StdErr Log File Path	Absolute path to the native.stderr Process log file.
Start Server Log File Path	Absolute path to the Start Server log file.
Stop Server Log File Path	Absolute path to the Stop Server log file.
Plugin Log File Path	Absolute path to the Plugin log file.

Select a Destination

1 The next window asks for the destination type; make sure **ArcSight Manager (encrypted)** is selected and click **Next**. (For information about this destination or any of the other destinations listed, see the *ArcSight SmartConnector User Guide.*)

2 Enter values for the **Manager Host Name**, **Manager Port**, **User** and **Password** required parameters. This is the same ArcSight user name and password you created during the ArcSight Manager installation. Click **Next**.

3 Enter a name for the SmartConnector and provide other information identifying the connector's use in your environment. Click **Next**. The connector starts the registration process.

4 The certificate import window for the ArcSight Manager is displayed. Select **Import the certificate to the connector from destination** and click **Next**. (If you select **Do not import the certificate to connector from destination**, the connector installation will end.) The certificate is imported and the **Add connector Summary** window is displayed.

Complete Installation and Configuration

1 Review the **Add Connector Summary** and click **Next**. If the summary is incorrect, click **Previous** to make changes.

2 The wizard now prompts you to choose whether you want to run the SmartConnector as a stand-alone process or as a service. If you choose to run the connector as a stand-alone process, select **Leave as a standalone application**, click **Next**, and continue with step 5.

3 If you chose to run the connector as a service, with **Install as a service** selected, click **Next**. The wizard prompts you to define service parameters. Enter values for **Service Internal Name** and **Service Display Name** and select **Yes** or **No** for **Start the service automatically**. The **Install Service Summary** window is displayed when you click **Next**.

4 Click **Next** on the summary window.

5 To complete the installation, choose **Exit** and Click **Next**.

For some SmartConnectors, a system restart is required before the configuration settings you made take effect. If a **System Restart** window is displayed, read the information and initiate the system restart operation.

> Save any work on your computer or desktop and shut down any other running applications (including the ArcSight Console, if it is running), then shut down the system.

For instructions about upgrading the connector or modifying parameters, see the *SmartConnector User Guide*.

Run the SmartConnector

SmartConnectors can be installed and run in stand-alone mode, on Windows platforms as a Windows service, or on UNIX platforms as a UNIX daemon, depending upon the platform supported. On Windows platforms, SmartConnectors also can be run using shortcuts and optional Start menu entries.

If the connector is installed in stand-alone mode, it must be started manually and is not automatically active when a host is restarted. If installed as a service or daemon, the connector runs automatically when the host is restarted. For information about connectors running as services or daemons, see the *ArcSight SmartConnector User Guide*.

To run all SmartConnectors installed in stand-alone mode on a particular host, open a command window, go to `$ARCSIGHT_HOME\current\bin` and run: `arcsight connectors`

To view the SmartConnector log, read the file `$ARCSIGHT_HOME\current\logs\agent.log`; to stop all SmartConnectors, enter `Ctrl+C` in the command window.

Device Event Mapping to ArcSight Fields

The following section lists the mappings of ArcSight data fields to the device's specific event definitions. See the *ArcSight Console User's Guide* for more information about the ArcSight data fields.

WebSphere Native StdErr Field Mappings

ArcSight ESM Field	Device-Specific Field
Agent (Connector) Severity	High = Fatal; Medium = Error, Warning, Configuration; Low = Audit, Information, Detail, Written to System.out by Application, Written to System.Err by Application
Device Event Category	message
Device External ID	_CUSTOM_HOST_NAME
Device Host Name	_CUSTOM_HOST_NAME
Device Product	'WebSphere'
Device Receipt Time	Timestamp
Device Severity	eventType (F\ = Fatal, E\ = Error, W\ = Warning, A\ = Audit, I\ = Information, C\ = Configuration, D\ = Detail, O\ = Written to System.out by Application, R\ = Written to System.Err by Application, Z\ = Unrecognized)
Device Vendor	'IBM'
Name	One of (message, environment)

WebSphere Native Stdout Field Mappings

ArcSight ESM Field	Device-Specific Field
Agent (Connector) Severity	High = Fatal; Medium = Error, Warning, Configuration; Low = Audit, Information, Detail, Written to System.out by Application, Written to System.Err by Application
Device Event Category	message
Device External ID	_CUSTOM_HOST_NAME
Device Host Name	_CUSTOM_HOST_NAME
Device Product	'WebSphere'
Device Receipt Time	Timestamp
Device Severity	eventType (F\ = Fatal, E\ = Error, W\ = Warning, A\ = Audit, I\ = Information, C\ = Configuration, D\ = Detail, O\ = Written to System.out by Application, R\ = Written to System.Err by Application, Z\ = Unrecognized)
Device Vendor	'IBM'
Name	message

WebSphere System.out Field Mappings

ArcSight ESM Field	Device-Specific Field
Agent (Connector) Severity	High = Fatal, Medium = Error, Warning, Configuration; Low = Audit, Information, Detail, Written to System.out by Application, Written to System.Err by Application, Fine, Finer, Finest, Trace
Destination Process Name	threadID
Device Custom String 3	className
Device Event Class ID	component
Device External ID	_CUSTOM_HOST_NAME
Device Host Name	_CUSTOM_HOST_NAME
Device Product	'WebSphere'

ArcSight ESM Field	Device-Specific Field
Device Receipt Time	Timestamp
Device Severity	eventType (F\ = Fatal, E\ = Error, W\ = Warning, A\ = Audit, I\ = Information, C\ = Configuration, D\ = Detail, O\ = Written to System.out by Application, R\ = Written to System.Err by Application, Z\ = Unrecognized, 1\ = Fine, 2\ = Finer, 3\ = Finest, <\ = Trace, >\ = Trace)
Device Vendor	'IBM'
File Name	fileName
File Path	filePath
Message	One of (message, environment)
Name	One of (message, envName)

WebSphere System.err Field Mappings

ArcSight ESM Field	Device-Specific Field
Agent (Connector) Severity	High = Fatal, Medium = Error, Warning, Configuration; Low = Audit, Information, Detail, Written to System.out by Application, Written to System.Err by Application
Destination Process Name	threadID
Device Custom String 2	shortName
Device Custom String 3	Class Name
Device Custom String 4	One of(Thread, More)
Device Custom String 5	Thread Name
Device Custom String 6	Line	'failed to load webapp'
Device Event Class ID	eventType (F\ = Fatal, E\ = Error, W\ = Warning, A\ = Audit, I\ = Information, C\ = Configuration, D\ = Detail, O\ = Written to System.out by Application, R\ = Written to System.Err by Application, Z\ = Unrecognized)
Device External ID	_CUSTOM_HOST_NAME
Device Host Name	_CUSTOM_HOST_NAME
Device Product	'WebSphere'
Device Receipt Time	Timestamp
Device Severity	eventType (F\ = Fatal, E\ = Error, W\ = Warning, A\ = Audit, I\ = Information, C\ = Configuration, D\ = Detail, O\ = Written to System.out by Application, R\ = Written to System.Err by Application, Z\ = Unrecognized)
Device Vendor	'IBM'
Message	One of (message, environment)
Name	eventType (F\ = Fatal, E\ = Error, W\ = Warning, A\ = Audit, I\ = Information, C\ = Configuration, D\ = Detail, O\ = Written to System.out by Application, R\ = Written to System.Err by Application, Z\ = Unrecognized)

WebSphere Plugin Field Mappings

ArcSight ESM Field	Device-Specific Field
Agent (Connector) Severity	Medium = ERROR; Low = PLUGIN, TRACE, DETAIL, DEBUG, STATS
Destination Process Name	threadID
Device Custom String 1	code
Device Event Category	messageType
Device Event Class ID	message
Device External ID	_CUSTOM_HOST_NAME

ArcSight ESM Field	Device-Specific Field
Device Host Name	_CUSTOM_HOST_NAME
Device Product	'WebSphere Plugin'
Device Receipt Time	date
Device Severity	messageType
Device Vendor	'IBM'
Message	message
Name	message
